

Job: Underpinning within an existing building

Location: Tegernsee Bavaria, Germany

After the concrete frame for the 3 storey apartment building was finished, too large and non equal settlements were discovered caused by varying ground water levels. Renovation was made by stabilising the foundation of the building with micropiles.

Material: approx. 30 nos. TITAN 40/16 micropiles, 8,0 m long installed in sections of 1,0 m length.
